[control-plane] Creating static Pod manifest for "kube-apiserver"
[control-plane] Creating static Pod manifest for "kube-controller-manager"
[control-plane] Creating static Pod manifest for "kube-scheduler"
[etcd] Creating static Pod manifest for local etcd in "/etc/kubernetes/manifests"
[wait-control-plane] Waiting for the kubelet to boot up the control plane as static Pods from
directory "/etc/kubernetes/manifests". This can take up to 4m0s
[apiclient] All control plane components are healthy after 19.001686 seconds
[uploadconfig] storing the configuration used in ConfigMap "kubeadm-config" in the "kube-
system" Namespace
[kubelet] Creating a ConfigMap "kubelet-config-1.13" in namespace kube-system with the
configuration for the kubelets in the cluster
[patchnode] Uploading the CRI Socket information "/var/run/dockershim.sock" to the Node API
object "k8s-master-1" as an annotation
[mark-control-plane] Marking the node k8s-master-1 as control-plane by adding the label "node-
role.kubernetes.io/master=''"
[mark-control-plane] Marking the node k8s-master-1 as control-plane by adding the taints
[node-role.kubernetes.io/master:NoSchedule]
[bootstrap-token] Using token: 8tpo9l.jlw135r8559kaad4
[bootstrap-token] Configuring bootstrap tokens, cluster-info ConfigMap, RBAC Roles
[bootstraptoken] configured RBAC rules to allow Node Bootstrap tokens to post CSRs in order
for nodes to get long term certificate credentials
[bootstraptoken] configured RBAC rules to allow the csrapprover controller automatically
approve CSRs from a Node Bootstrap Token
[bootstraptoken] configured RBAC rules to allow certificate rotation for all node client
certificates in the cluster
```

```
[bootstraptoken] creating the "cluster-info" ConfigMap in the "kube-public" namespace
```

```
[addons] Applied essential addon: CoreDNS
```

```
[addons] Applied essential addon: kube-proxy
```

Your Kubernetes master has initialized successfully!

To start using your cluster, you need to run the following as a regular user:

```
mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config
```

You should now deploy a pod network to the cluster.

Run "kubectl apply -f [podnetwork].yaml" with one of the options listed at:

<https://kubernetes.io/docs/concepts/cluster-administration/addons/>

You can now join any number of machines by running the following on each node as root:

```
kubeadm join 192.168.0.127:6443 --token 8tpo9l.jlw135r8559kaad4 --discovery-token-ca-cert-hash sha256:d6594ccc1310a45cbefbc45f1c93f5ac113873786365ed63efcf667c952d7d197
```

- master

```
mkdir -p $HOME/.kube
sudo cp -i /etc/kubernetes/admin.conf $HOME/.kube/config
sudo chown $(id -u):$(id -g) $HOME/.kube/config
export KUBECONFIG=$HOME/.kube/config
```

- master

```
kubeadm token list
```

```
kubectl cluster-info
```

- master Flannel

```
cd /opt && wget https://raw.githubusercontent.com/coreos/flannel/master/Documentation/kube-flannel.yml
```

```
kubectl apply -f /opt/kube-flannel.yml
```

- node

```
echo 1 > /proc/sys/net/bridge/bridge-nf-call-iptables
```

```
kubeadm join 192.168.0.127:6443 --token 8tpo9l.jlw135r8559kaad4 --discovery-token-ca-cert-hash sha256:d6594ccc1310a45cbebc45f1c93f5ac113873786365ed63efcf667c952d7d197
```

```
[preflight] Running pre-flight checks
```

```
[discovery] Trying to connect to API Server "192.168.0.127:6443"
```

```
[discovery] Created cluster-info discovery client, requesting info from  
"https://192.168.0.127:6443"
```

```
[discovery] Requesting info from "https://192.168.0.127:6443" again to validate TLS against  
the pinned public key
```

```
[discovery] Cluster info signature and contents are valid and TLS certificate validates  
against pinned roots, will use API Server "192.168.0.127:6443"
```

```
[discovery] Successfully established connection with API Server "192.168.0.127:6443"
```

```
[join] Reading configuration from the cluster...
```

```
[join] FYI: You can look at this config file with 'kubectl -n kube-system get cm kubeadm-  
config -oyaml'
```

```
[kubelet] Downloading configuration for the kubelet from the "kubelet-config-1.13" ConfigMap  
in the kube-system namespace
```

```
[kubelet-start] Writing kubelet configuration to file "/var/lib/kubelet/config.yaml"
```

```
[kubelet-start] Writing kubelet environment file with flags to file "/var/lib/kubelet/kubeadm-  
flags.env"
```

```
[kubelet-start] Activating the kubelet service
```

```
[tlsbootstrap] Waiting for the kubelet to perform the TLS Bootstrap...
```

```
[patchnode] Uploading the CRI Socket information "/var/run/dockershim.sock" to the Node API  
object "k8s-node-1" as an annotation
```

This node has joined the cluster:

* Certificate signing request was sent to apiserver and a response was received.

* The Kubelet was informed of the new secure connection details.

Run 'kubectl get nodes' on the master to see this node join the cluster.

- node `kubeadm reset` join
- master `kubectl get cs`

NAME	STATUS	MESSAGE	ERROR
controller-manager	Healthy	ok	
scheduler	Healthy	ok	
etcd-0	Healthy	{"health": "true"}	
	Healthy	`kubeadm reset`	

- master `kubectl get nodes`

```
NotReady      kubectl get pods --all-namespaces
Pending/ContainerCreating/ImagePullBackOff   Pod          Pod
kubectl describe pod <Pod Name> --namespace=kube-system
kubectl logs <Pod Name> -n kube-system
tail -f /var/log/messages
